FEATURES

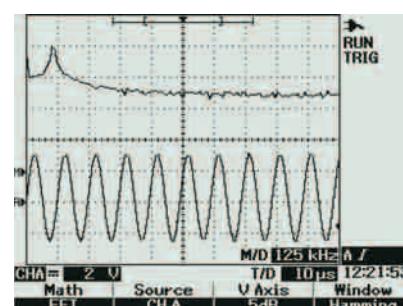

Record Length

A long record length and high-speed sampling rates allows the user to capture and view a more detailed "picture" of a complex Waveform and its components. Up to 125kB samples of waveform information may be captured and accurately displayed on the LCD screen as shown in the illustration below.

Math

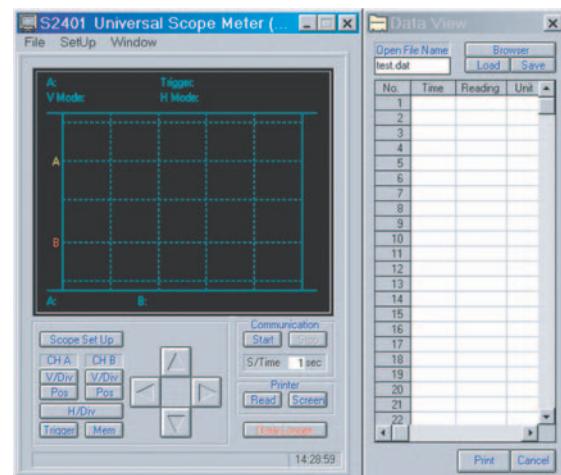

Dual channel Math functions are available for adding and subtracting waveforms applied to the CHA and CHB inputs. The FFT allows you to view a waveform spectrum using a Rectangular, Hamming, Hanning or Black Man-Harris window.

320 x 240 pixel LCD for displaying the component value along with its Q or D value in a absolute, Δ or $\% \Delta$ display. Test Frequency, Test voltage, Circuit mode, Number of averages, Binning and the Soft Keys for selecting these parameters are also displayed.

The function Keys select the operating parameters displayed on the LCD. Trigger mode, Measurement rate, Component value in absolute, Δ or $\% \Delta$ are some of the functions that may be selected.

EXT Bias key when in the C+D or C+R mode allows an external bias voltage up to 60V to be applied to the capacitor under test. This is normally used to stabilize a High value Electrolytic for an accurate reading.

Selects the type of component and parameter to be measured. R&Q, L&Q, C&D, C&R or Auto may be selected.

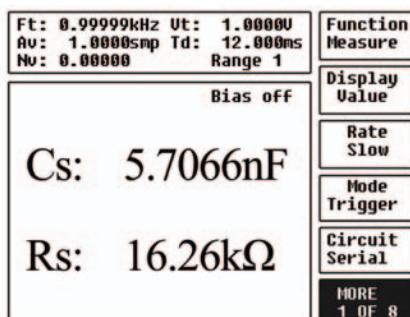

Numeric keyboard for entering Test Frequency, Voltage values, Number of averages, Cal Data Measurement delay and Nominal values.

Four wire input: 2 inputs supply the drive signal and 2 inputs are for input sensing, thereby removing errors caused by lead length.

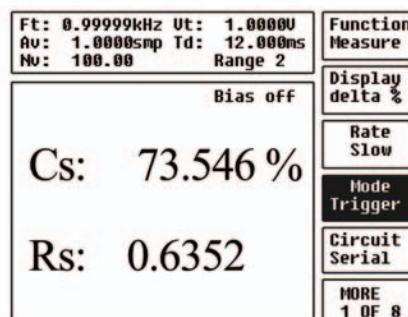

These two keys are used to adjust the contrast of the LCD display.

The start key initiates a measurement in the triggered mode.

DISPLAY

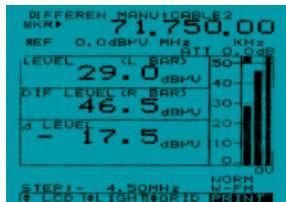

SPECTRUM ANALYZER DISPLAY

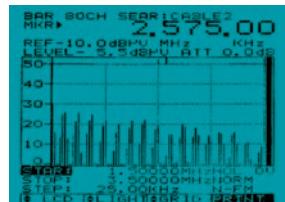

CHANNEL EDIT MODE

Up to 1600 channels may be stored in any order, then scanned and identified by 9-digit freq. and 5-letter title. Useful for Cable TV, Cellular phone, and other field applications where repetitive measurements need to be made.

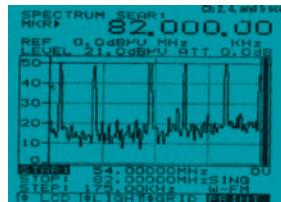

TWO CHANNEL DIFFERENCE MODE

TWO CHANNEL DIFFERENCE MODE
This Mode displays 2 carrier levels and their difference. A key application verifies that a TV or Cable channel's video and audio carriers are within specifications.

BAR-GRAPH DISPLAY

BAR-GRAPH DISPLAY
This feature makes level readings easy and "cleans up" each frequency (compared to a spectrum display). Patterns may be readily seen, for example: this display of computer monitor radiation.

SPECTRUM DISPLAY

SPECTRUM DISPLAY
This Mode scans and displays 160 channels. Squelch level may be set above or below carrier level in order to pause scan and detect the signal. Detection modes are AM, NFM, WFM and SSB.
